Age and COVID-19

Why are there so few cases in children? To become a case requires:

1) **contact** with an infected person

2) **susceptibility** to infection

3) **symptoms** given infection

4) **transmissibility** of contact

Age and COVID-19

Why are there so few cases in children? To become a case requires:

1) **contact** with an infected person → Are **contacts** more frequent among adults than children?

2) **susceptibility** to infection

3) **symptoms** given infection

4) **transmissibility** of contact

Age and COVID-19

Why are there so few cases in children? To become a case requires:

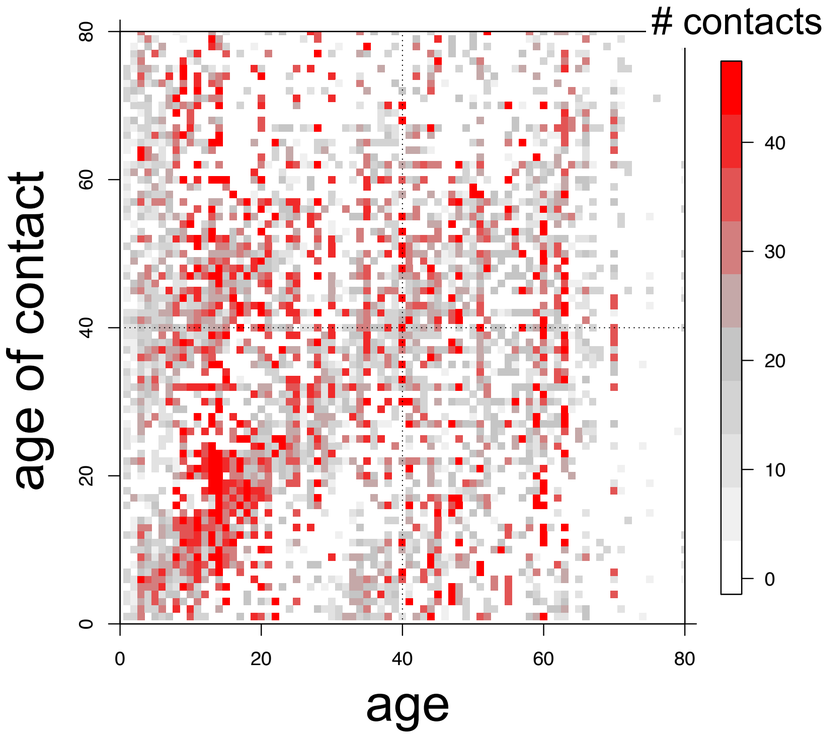
1) **contact** with an infected person

2) **susceptibility** to infection

3) **symptoms** given infection

4) **transmissibility** of contact

Are **contacts** more frequent among adults than children?



Not normally!

raw POLYMOD data, Mossong et al. 2009

Age and COVID-19

Why are there so few cases in children? To become a case requires:

1) **contact** with an infected person

2) **susceptibility** to infection

3) **symptoms** given infection

4) **transmissibility** of contact

Are **contacts** more frequent among adults than children?

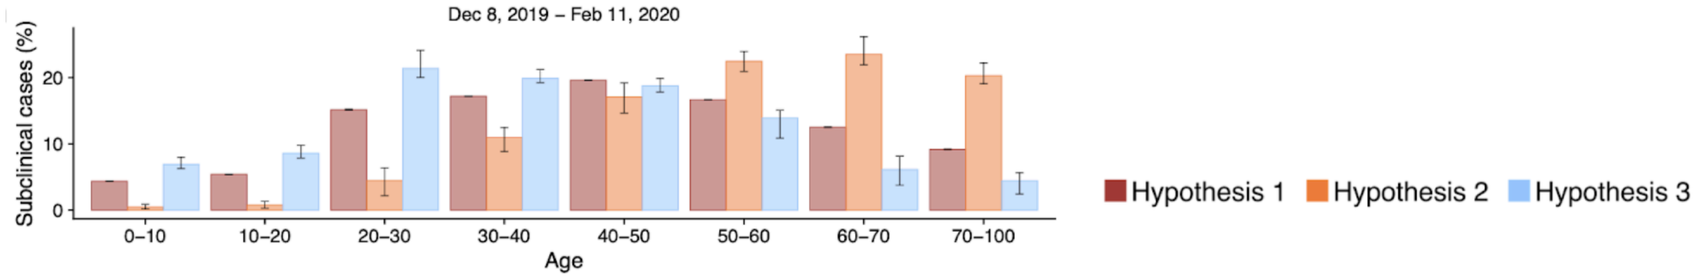
A formal test: age and COVID-19

Age-dependent effects in the transmission and control of COVID-19 epidemics

Authors: Nicholas G. Davies[1*], Petra Klepac[1^], Yang Liu[1^], Kiesha Prem[1], Mark Jit[1], CMMID COVID-19 working group, Rosalind M Eggo[1*]

Model fitting to test three hypotheses:
(1) age contact; (2) age susceptibility; (3) age symptoms

Found (2) & (3) better than (1); and (3) better than (2) overall, with key distinction being # subclinical infections that occur in adults (many more required for (2)).



https://www.medrxiv.org/content/10.1101/2020.03.24.20043018v1

A formal test: age and COVID-19

Age-dependent effects in the transmission and control of COVID-19 epidemics

Authors: Nicholas G. Davies[1*], Petra Klepac[1^], Yang Liu[1^], Kiesha Prem[1], Mark Jit[1], CMMID COVID-19 working group, Rosalind M Eggo[1*]

Model fitting to test three hypotheses:
(1) age contact; (2) age susceptibility; (3) age symptoms

Found (2) & (3) better than (1); and (3) better than (2) overall, with key distinction being # subclinical infections that occur in adults (many more required for (2)).

Discrimination between (2) and (3) hinges on late age subclinical infections being very high in (2) - little evidence to say this isn't the case, yet?

https://www.medrxiv.org/content/10.1101/2020.03.24.20043018v1

A formal test: age and COVID-19

Age-dependent effects in the transmission and control of COVID-19 epidemics

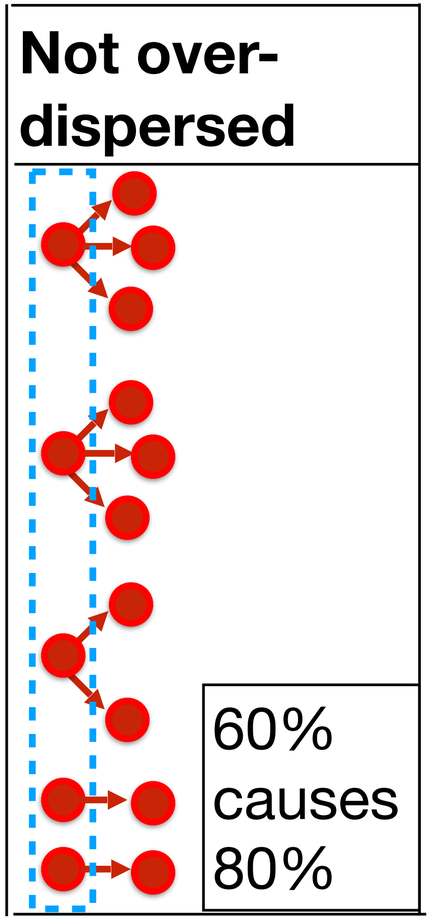
Model fitting to test three hypotheses:
(1) age contact; (2) age susceptibility; (3) age symptoms

Found (2) & (3) better than (1); and (3) better than (2) overall, with key distinction being # subclinical infections that occur in adults (many more required for (2)).

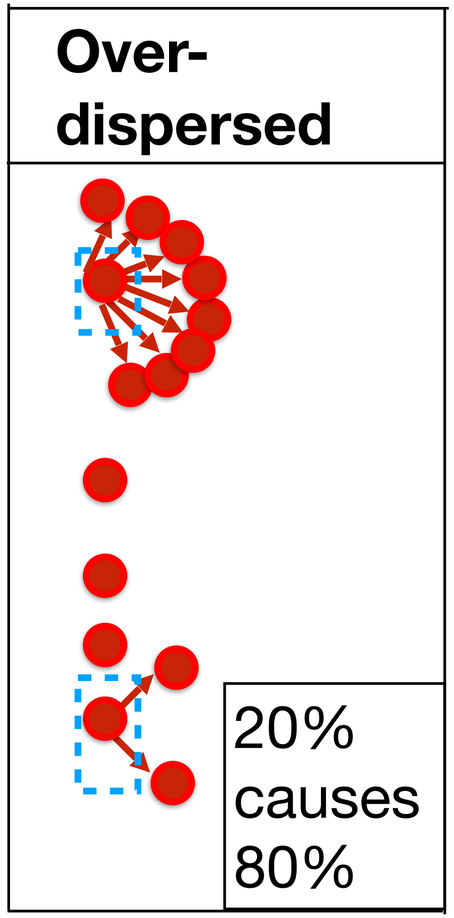
?possibility of higher transmission from older individuals.

https://www.medrxiv.org/content/10.1101/2020.03.24.20043018v1

Transmissibility: 'Super-spreading events'?

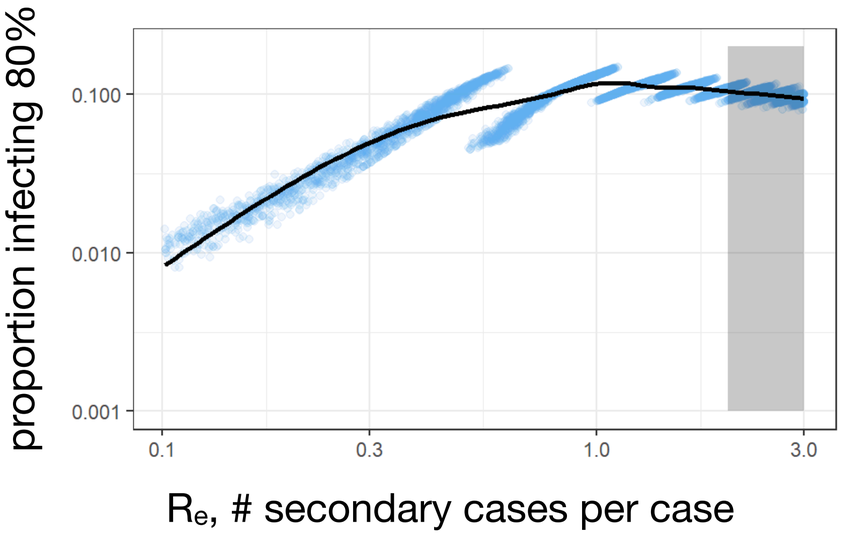


100% of introductions cause onward transmission



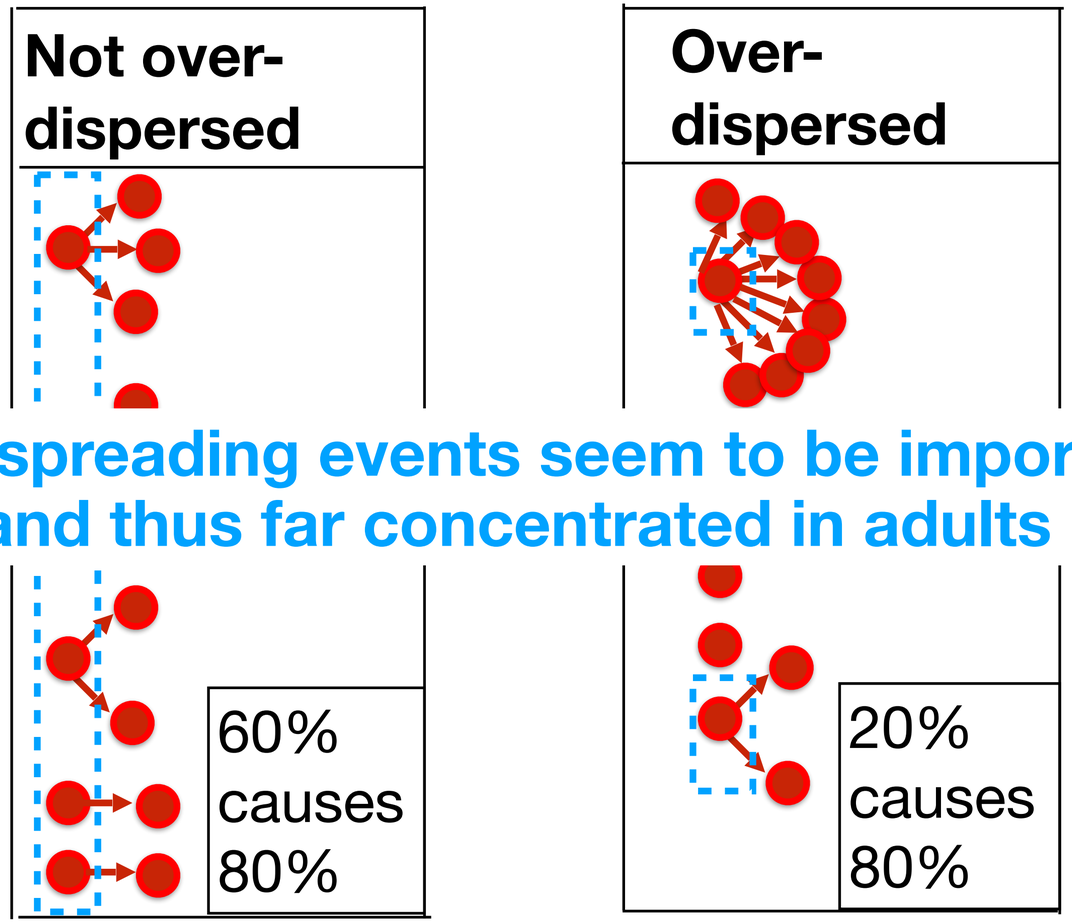
40% of introductions cause onward transmission

Map observed (165 introductions; 84 local cases)



https://hopkinsidd.github.io/nCoV-Sandbox/DispersionExploration.html

Transmissibility: 'Super-spreading events'?

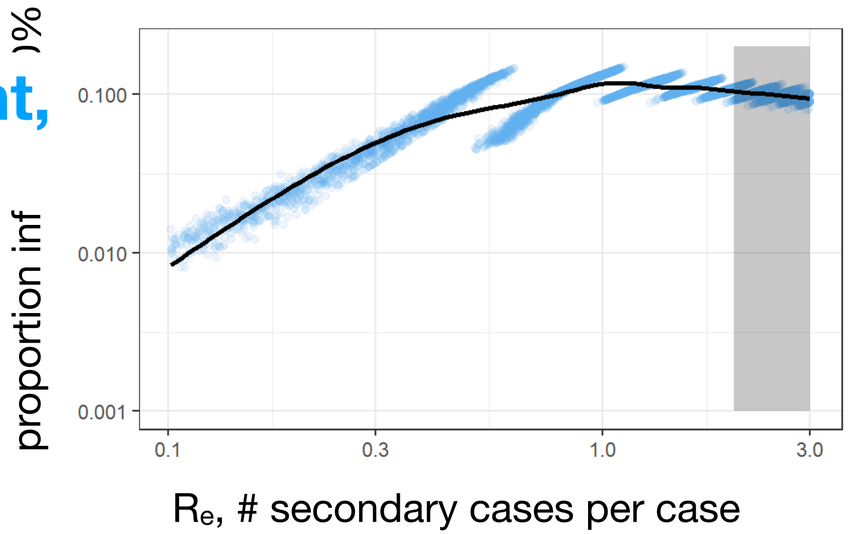


Superspreading events seem to be important, and thus far concentrated in adults

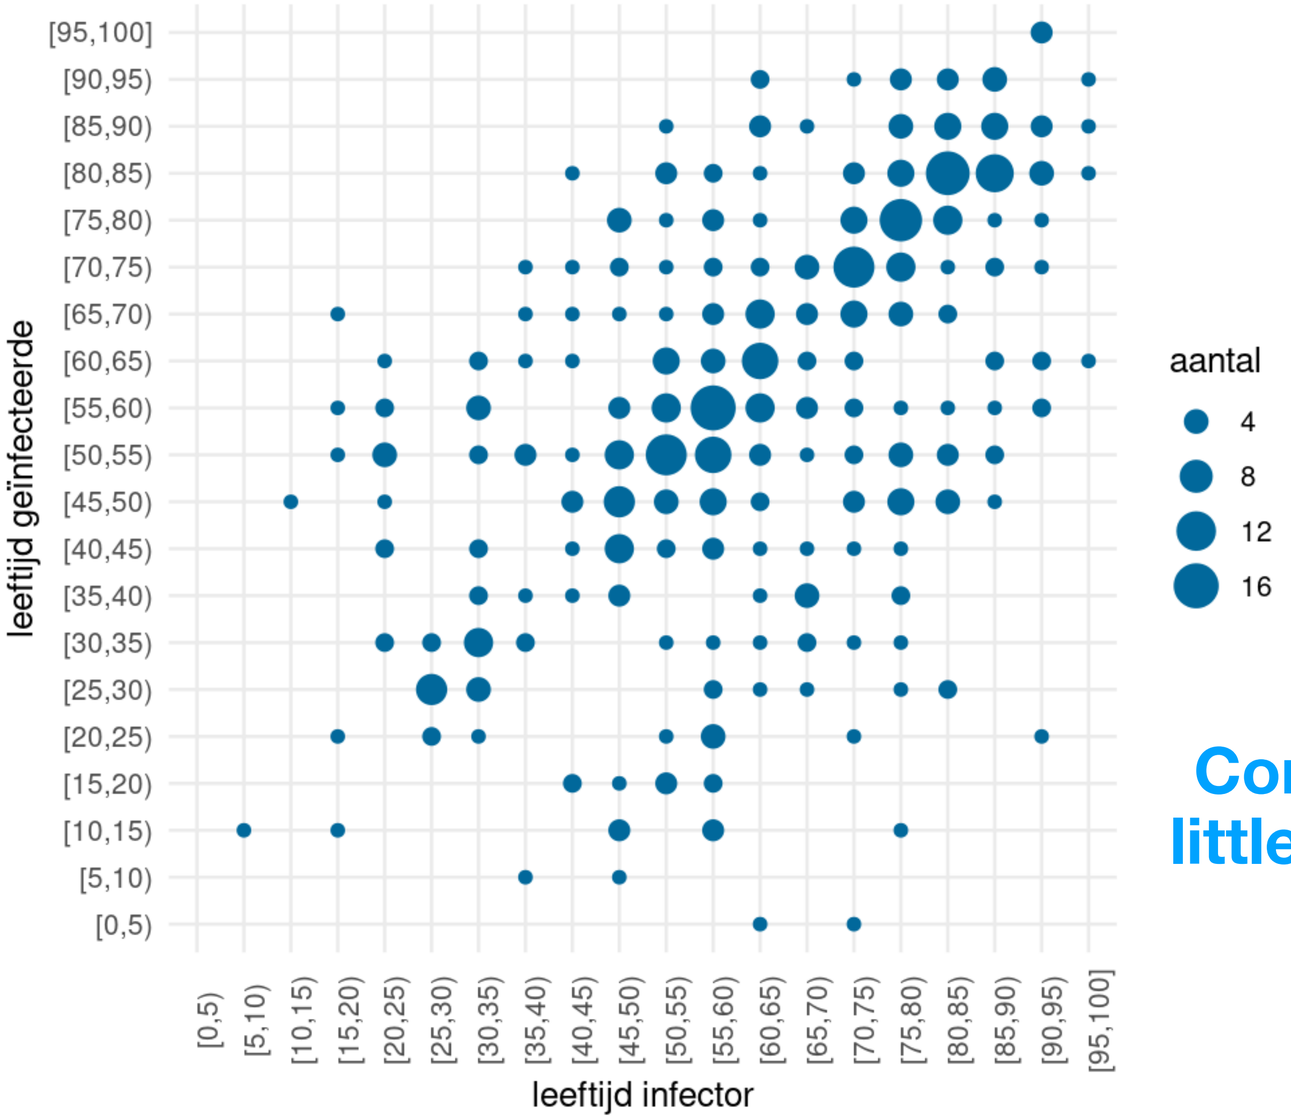
100% of introductions cause onward transmission

40% of introductions cause onward transmission

Map observed (165 introductions; 84 local cases)



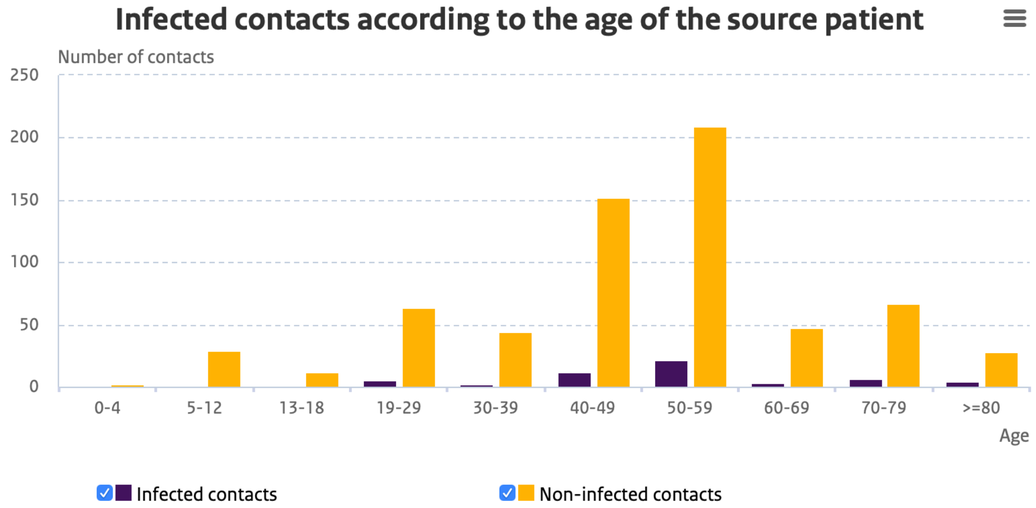
Recent data out of Holland

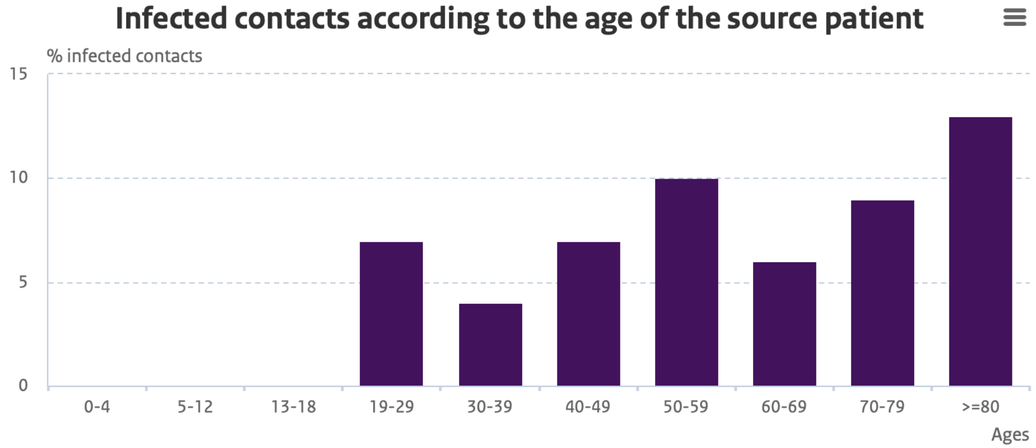


Contact tracing suggests very little transmission from children

https://www.rivm.nl/en/novel-coronavirus-covid-19/children-and-covid-19

Recent data out of Holland





But why do older individuals have so many contacts? something strange about this data?

https://www.rivm.nl/en/novel-coronavirus-covid-19/children-and-covid-19

Age and COVID-19

Why are there so few cases in children? To become a case requires:

1) **contact** with an infected person
2) **susceptibility** to infection
3) **symptoms** given infection
4) **transmissibility** of contact

Children:

-may be less susceptible,

-may be less likely to show symptoms,

-this may be associated with less transmission…

…but hard to say still; and contacts are still in flux (school closures, etc).

Implications of the age profile of the novel coronavirus.

James A. Hay[1], David J. Haw[2], William P. Hanage[1], C. Jessica E. Metcalf[3], Michael J. Mina[1,4,5,*]
